

C# Advanced Lab - Algorithms

This document defines **algorithmic problems** from the ["Advanced C#" Course @ Software University](https://softuni.org/courses/advanced-csharp). You are presented with some problems and certain steps you need to take in order to accomplish the tasks.

Problem 5. Largest Rectangle

Write a program to **find the largest rectangular area in a rectangular matrix** of strings. The area should hold equal cells at its **borders**. The area size is calculated by the classical formula **width * height**.

Input

The input comes as from the console. Each row of the matrix is on a **separate line**; **each cell is surrounded by commas (',') on both sides**. The input ends with the keyword **"END"**.

Output

The output should be printed on the console. **Border cells of the largest rectangle** should be enclosed in square brackets ([]) and colored in **green**. Each cell should be **padded 5 spaces to right**. Ensure all your cell data is correctly encoded as HTML (use the **SecurityElement.Escape** method).

Constraints

- The input will always contain data for a matrix with a rectangular form.
- The minimal size of the matrix will be 1 x 1. The maximum matrix size will be 20 x 20.
- Allowed working time: 0.2 seconds. Allowed memory: 16 MB.

Examples

Input	Output
